Search Notes

I searched the starting materials in Casreact, a reaction database. There were 22 CA references where the dicyandiamide and the diamine were the starting materials. None of the references included formaldehyde and none seemed pertinent.

I also searched in CA using a combination of the registry numbers and names of the starting materials, limited by utility. There are some answers (marked) which have good dates and may be useful.

If you have any questions give me a call.

Fuller

Access DB# 171046

SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: GREG DELCOTTO Examiner #: 72268 Date: 11/16/05
 Art Unit: 1751 Phone Number: 302-1312 Serial Number: 10/085997
 Mail Box and Bldg/Room Location: RAMSEY 9A37 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Laundry detergents and laundry treatment compositions comprising inhibiting dye transfer

Inventors (please provide full names): FRANK PETER LANG, HELMUT BERENBOLO,
MICHAEL WESSLING

Earliest Priority Filing Date: 9/3/01

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

Voluntary Results Feedback Form

- I am an examiner in Workgroup: Example: 1713
- Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

- Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

AB 3-[3-(Piperidinomethyl)phenoxy]alkyl, N-cyano-N'-[ω-[3-(1-piperidinylmethyl)phenoxy]alkyl]guanidine and 2-(5-methyl-4-imidazolyl)methyl thioethyl derivs. containing fluorescent functionalities were synthesized and their histamine H2 receptor affinity was evaluated using the H2 antagonist [125I]-aminopotentidine. The compds. exhibited weak to potent H2 receptor affinity with pKi values ranging from <4 to 8.85. The highest H2 receptor affinity was observed for guanidines I [n = 2, R = NHCOC6H4NHMe-2, 1-cyano-2-indolizinecarboxamido; n = 3, R = 1-cyanoisindol-2-yl].

AB The synthesis of isosteres of 1,4-dihydro-2,6-dimethyl-4-[3-[[[3-(1-piperazinyl)propyl]amino]carbonyl]amino]phenyl]-3,5-pyridinedicarboxylic acid di-Me ester (I) (urea) and of 4-[3-[[[(cyanoamino)[3-(1-piperazinyl)propyl]amino]methylene]amino]phenyl]-1,4-dihydro-2,6-dimethyl-3,5-pyridinedicarboxylic acid di-Me ester (II) (cyano guanidine) is reported. 4-Amino-N-arylpiperidines serve as effective bioisosteres for N-arylpiperazines in the series of dihydropyridine NPY₁ receptor antagonists. These were prepared by a ZnCl₂-mediated reductive amination reaction between elaborated primary amines, 2 or 5, and 4-arylpiperidones. An example compound was the isosteric piperidiylamino analog III of the lead compound I. Both, cyanoguanidine and urea analogs were evaluated for their biol. activity.

AB EPR studies were conducted on [Cu(II) (1-phenylamidino-O-n-butylurea) en
 (H₂O)]₂²⁺ (1) and [Cu(II) sulfato-mono (1-phenylamidino-O-methylurea)]₂

(2), resp., in the temperature range 300-77 K Fine structure characteristics of $S = 1$ system, was observed in both complexes with zero field splitting of 0.0525 and 0.0225 cm^{-1} , resp., suggesting the formation of dimeric complexes. The presence of the half-field signal ($\Delta M_s = \pm 2$), in the complex 1, further confirmed the formation of dimer. The temperature dependence of EPR signal intensity gave evidence for the ferromagnetic (FM) coupling between the two Cu^{2+} ions. The isotropic exchange interaction consts. J , were evaluated from this and are .apprx.57 and .apprx.27 cm^{-1} , resp., for the complexes 1 and 2. The photoacoustic spectra of these complexes had shown a band around 26,400 cm^{-1} characteristic of metal-metal bonding giving an independent support for the existence of dimeric Cu^{2+} species. The high magnetic moment values at room temperature for complex 1 (2.68 μ_B) and complex 2 (2.00 μ_B), obtained from the magnetic susceptibility measurements, support the formation of ferromagnetically coupled Cu^{2+} dimers.

DT Journal

LA English

AB A Cu(II)-dicyanamide (dca = dicyanamide anion, [N(CN)₂]⁻) compound, [Cu(dca)₂(en)]_n (1) (en = ethylenediamine), was synthesized and its structure was determined by single x-ray diffraction anal. It crystallizes in the monoclinic space group C2/c with a 12.031(2), b 8.614(1), c 19.528(3) Å, β 99.499°, Z = 8. 1 is the 1st coordination polymer containing both μ 1,5-dca and pseudo- μ 1,3-bridging dca. The adjacent Cu atoms are connected by dca with μ 1,5-bridging mode to form a chain structure. Also, the chains are cross linked via the pseudo- μ 1,3-bridging dca into a 2-dimensional layer structure. Magnetic characterization of 1 suggests that the complex exhibits a weak antiferromagnetic interaction between the Cu(II) ions.

PB Royal Society of Chemistry

DT Journal; (online computer file)

LA English

AB Elegant supramol. architectures are formed by Cu(II) halide complexes of polymethylene-linked bis(amidino-O-alkylurea) ligands (L2m: C2-linked, alkyl = Me; L3m: C3-linked, alkyl = Me; L2e: C2-linked, alkyl = Et; L3e: C3-linked, alkyl = Et). The tetradentate ligands coordinate Cu(II) to give square planar [CuL]2+ complex cations, which, owing to their versatile H-bonding capacity, form diverse H-bonded supramol. synthons with the anions. Structural anal. of four chlorides, [CuL2m]Cl2·2H2O 1, [CuL2e]Cl2·MeOH·3H2O 2a, [CuL3m]Cl2·MeOH·0.5H2O 5a and [CuL2m]4[CuCl4]Cl6·5H2O 9, and a single bromide, [CuL3m]Br2·MeOH·0.3H2O 7a, revealed two conserved supramol. synthons, one of which is present in four structures, the other of which is present in three structures. The basic building block in 2a, 5a, 7a and 9 is a H-bonded 1-dimensional chain of alternating [CuL]2+ cations and halide anions. A slightly modified motif, including a H2O mol., occurs in 1. The chains are linked into

2-dimensional sheets by H-bonding contacts involving the anions and solvate (water and/or MeOH)mols., either directly (1) or via formation of ribbons (2a, 5a, 7a and 9). When linked directly the cations in adjacent chains are parallel, but when linked via ribbons they are alternating.

3-D frameworks result from a combination of elongated axial

Cu...Cl contacts and complex H-bonding contacts

involving the anions and solvate mols.

AB 2,4,8,10-Tetraoxaspiro[5,5]undecanes tetrasubstituted at the 3 and 9 positions with groups incorporating diaminotriazines can be used for the construction of extensively hydrogen-bonded networks by the strategy of mol. tectonics. Four such compds., tectons 1-4, were made by short and efficient syntheses involving bisketalization of pentaerythritol and subsequent reactions. Unlike tectons typically used in previous studies, compds. 1-4 are flexible and chiral, and they orient four sticky diaminotriazine groups in a distorted tetrahedral geometry. Tecton 1 crystallizes from DMF/toluene as an inclusion compound of approx. composition 1.8DMF·xH2O. In the resulting structure, each tecton participates in a total of 16 hydrogen bonds. Eight of these bonds involve four principal neighbors, and the tectons linked in this way define a distorted diamondoid network. Despite 8-fold interpenetration, 60% of the volume of the network is available for including guests. The guests are disordered and occupy parallel helical channels that have cross sections of approx. 11 + 12 Å² at the narrowest points. These channels provide access to the interior of the crystals and permit guests to be exchanged quant. without loss of crystallinity. It is noteworthy

that tecton 1, despite its flexibility, small size, and structural simplicity, is apparently unable to find a periodic three-dimensional structure in which the dictates of hydrogen bonding and close packing are satisfied simultaneously.

 AB Two dicyanamide (dca) M(III) complexes with salen ligand, [Mn(III)(salen)(dca)]_n (1) and [Fe(III)(salen)(dca)]_n (2), were synthesized and characterized. X-ray diffraction analyses revealed the two complexes have a similar 1-dimensional zigzag chain structure constructed by μ 1,5-dca bridges. Magnetic susceptibility measurements indicate antiferromagnetic interactions between two intra-chain high-spin Mn(III) ions and between two intra-chain low-spin Fe(III) ions via the dca bridge. The electrochem. properties of the two complexes were studied by cyclic voltammetry.

AB New anti-Helicobacter pylori (H. pylori) agents endowed with H2-antagonists properties were obtained by combining the lamtidine derived pharmacophoric group with the antibiotic calvatic acid. All the compds (I; n = 2, 4, 6) were tested for their irreversible H2-antagonist properties and for their ability to inhibit 20 H. pylori strains, two of them metronidazole resistant. The most active derivative I (n = 4) displayed antimicrobial activity similar to metronidazole. The synthesis and pharmacol. of new anti-Helicobacter pylori agents endowed with H2-antagonist properties are reported.

AB The syntheses and structure-activity relationships of a series of
 2-substituted 4,5-bis(4-methoxyphenyl)pyrimidines, designed on the basis
 of structural analyses of several cyclooxygenase (CO) inhibitors, and
 their derivs. as anti-platelet agents based on CO inhibition are
 described. Among them, 4,5-bis(4-methoxyphenyl)-2-morpholinopyrimidine
 and 4,5-bis(4-methoxyphenyl)-2-(3,5-dimethylmorpholin-4-yl)pyrimidine
 showed potent inhibitory activity on malondialdehyde, formed by the
 CO-catalyzed oxygenation of arachidonic acid (A.A.) in prostanoids, production
 in vitro (73.4% inhibition at 10^{-8} M and $IC_{50} = 1.4 \times 10^{-8}$ M,
 resp.). Certain compds. were also examined in ex vivo studies. Of these
 compds., 4,5-bis(4-methoxyphenyl)-2-(1-methyl-1,2,3,6-tetrahydropyrid-4-
 yl)pyrimidine (11a) exhibited potent and long-lasting anti-platelet
 activity ex vivo, i.e., 11a showed 97% inhibition of platelet aggregation
 induced by A.A. even 24 h after oral administration of 3.2 mg/kg in guinea
 pigs, and 60-70% inhibition at 6 h after lower doses (1.0 mg/kg). The ex
 vivo activity of 11a is more than three times that of aspirin (aspirin
 showed 81% inhibitory activity on platelet aggregation induced by A.A. at
 6 h after oral administration at 10 mg/kg in this study). Compound 11a also
 showed vasodilatory activity ($ED_{50} = 5.3 \times 10^{-6}$ M, while aspirin has
 no vasodilatory activity at 6.0×10^{-4} M).

AB The reactions of the title compound (MeS)2C:NC(NH2):NCN (I) with amines were investigated and several 1-substituted hydrotriazines were prepared. I reacted with primary amines below room temperature to give N-substituted N'-(N2-cyanoamidino)-S-methylisothiourea, which easily cyclized to 1-substituted 4-amino-2-imino-6-methylthio-1,2-dihydro-1,3,5-triazines II (R = Me, Bu, PhCH2) by warming up to 30°. The reaction of I with aniline hydrochloride in ethanol yielded 1-phenylhydrotriazine, whereas in dioxane, 2-amino-4-methylthio-6-phenylamino-1,3,5-triazine was obtained. II reacted with amines in the presence of acid and with cyanamide in the presence of alkali to produce corresponding 1,2-disubstituted isomelamines III (R1 = Me, Me2CH, Bu, PhCH2) in good yield.

AB A laundry article effective for inhibiting transfer of extraneous dyes and soil to articles in a wash liquor, said laundry article comprising a support matrix and a functionalized polyamine attached to or entrapped in the support matrix. The functionalized polyamine comprises the reaction product of (A) a cyano- or guanidino-containing compound and (B) a polyamine prepared from at least one monomeric amine. The laundry article inhibits dye transfer, soil redeposition, and provides color protection to fabrics in a wash liquor. In addition, the laundry article does not interfere with the removal of stains from fabrics washed in the presence of the laundry article. Furthermore, the laundry article containing the functionalized polyamines are economical and environmentally safe.

AB Basic polycondensates are obtained by reaction of (a) an amine R1R2NANR3R4 (R1-4 = H, or alkyl which is unsubstituted or substituted by amino, hydroxy, cyano or C1-4 alkoxy, and A = alkylene which is unsubstituted or substituted or which may be interrupted by heteroatom), with an ammonium salt in the presence of a nonaq. solvent, and (b) reacting the protonated product (a) with a cyanamide at elevated temperature, for the antimicrobial treatment of the human skin, of textile fiber materials, paper or card-board and hard surfaces. An example dishwashing detergent contained basic polycondensate of NH₄Cl, diethylenetriamine, and dicyandiamide 0.01-10, Na lauryl sulfate 7.0, Na myreth sulfate 7.0, lauryl glucoside 4.0, cocobetaine 1.1, EtOH 5.0, NaCl 1.0, citric acid, perfume, and water.

GI					

AB The dye RCH:CHR (I; R = II) gives good results in dyeing hydroxy group-containing fibers, such as cellulosic fibers, in aqueous medium in the presence of a salt at pH 5-9 and temperature 60-130°. The dyed material is then fixated with (a) reaction products of functionalized amines with cyanamide, dicyandiamide, guanidine, or biguanidine; or with reaction product of ammonia with cyanamide or dicyandiamide (the reaction products contain in all cases reactive H atoms bonded to the N atom), (b) quaternary polyalkylene-polyamines, or (c) N-methylol derivs. of urea, melamine, guanamine, triazinone, uron, or a carbamate or acid amide, eventually in the presence of crosslinking catalysts. Thus, 0.1 parts I was dissolved in 200 parts demineralized water and the solution was heated to 40-50°. Cotton fabric (10 parts) was then added and the system was heated for 30 min till the temperature reached 90°. Calcined Glauber salt (3 parts) was then added, and dyeing continued at pH 7 at 90° for 35 min. The dyed cotton fabric was subsequently treated with a fixation solution prepared at 110° by condensation of 103 parts diethylenetriamine with 84 parts dicyandiamide; fixation proceeded at 70° for 3 h. The obtained bright red fabric exhibited excellent laundering stability.

AB Substrates of catalyzed C particles are prepared by 1st reacting an amine compound with HCOH and/or polymerized HCHO in solution, in the presence of a catalyst, C particles, and a metal (Co, Ni, Fe, Cu, V, Cr, and/or Mn) salt at .apprx.50-100° and at a sufficient stirring rate to provide a polymerized product in the form of a gel. The gel is heated, pyrolyzed in an

inert atmospheric at .apprx.600-1000° for a sufficient time to form a metal-N-heterocarbon complex supported on internal and external surfaces of the C particles. The powder is mixed with a binder, and electrodes are pressed and formed into a suitably shaped substrate of catalytic C.

AB The release of HCHO from dyed finished fabrics depends not only on the pH, catalyst, and curing conditions, but also on the structure of the dye present and the chemical nature of additives. Substances containing amine groups reduce HCHO release considerably. Interactions of the scavenger mol. with various groups of the dye chromophore affect the color characteristics of the finished fabric.

AB A hologram which uses gelatin as the binder is prepared by exposing a holog. material to a coherent light source, developing the holog. image by a chemical or phys. process, and treating the material before, during, or after development with a solution of a gelatin reactive compound which has a mol. weight >200 and reacts with the gelatin to form covalent bonds and thus to increase the mol. bulk of the gelatin. Thus, a transparent photog. film support was coated with a AgBr-gelatin holog. emulsion sensitized to 630 nm, exposed by a Denisyuk method to a He-Ne laser using a brushed Al plate as the object, developed in a solution containing Na2SO3, hydroquinone, and Na2CO3, bleached in a solution containing Fe(NH4)EDTA and KBr, washed, and treated with an aqueous solution containing a reaction product of HCHO, NH4Cl, ethylenediamine, and dicyandiamide to give a hologram with a bathochromic shift of 64.7 nm compared to a control without the treatment by the reaction product.

GI					

AB A multicolored hologram which uses gelatin as the binder having interference fringes lying in layers parallel to the substrate and whose colors are visible by reflection in incident natural light is prepared by applying to the selected areas of a processed gelatin hologram containing interference fringes a compound which causes the interference fringes to sep. permanently and produce a bathochromic shift in the replay wavelength. The gelatin reactive compound is an onium compound containing ≥ 1 C10-18alkyl or a quaternary ammonium compound having the general formula $N^+RR_1R_2R_3X^-$ (R = C10-18 alkyl; R₁, R₂ = C1-2 alkyl; R₃ = C1-2 alkyl, aralkyl, cycloalkyl, ZNR₄R₅ where Z = alkylene; R₄, R₅ = C1-2 alkyl, R₁R₂R₃ may represent the atoms necessary to complete a heterocyclic aromatic ring group; X⁻ = anion). The hologram is of particular use in identification and security cards. Thus, a transparent photog. film support was coated with a AgBr-gelatin emulsion sensitized to 633 nm, exposed to a He-Ne laser by the Denisyuk exposure method using a brushed Al plate as an object, developed in a solution containing Na₂SO₃, hydroquinone, and Na₂CO₃, bleached in a solution containing Fe(NH₄)EDTA and KBr, washed, dried, a portion of the resultant gelatin hologram contacted with a solution containing orange dye I, and dried to give a hologram in which the portion contacted with the dye solution was visible in ordinary ambient light.

PRAI DE 1982-3242155 A 19821113

AB Tubular cellulosic knits are azoically dyed fast shades by pretreating the knit, before impregnating with the coupling component, with a cationic compound based on a dicyandiamide-formaldehyde condensate and a combination wetting agent containing a Na alkyl sulfonate and a condensate [9043-30-5] of 1 mol isotridecanol with 8 mol ethylene oxide, rinsing, and dyeing with components to form azo dyes. Thus, a cotton knit was treated with a bath containing 5 g/L of a condensation product from ethylenediamine sulfate 1, dicyandiamide 2, and formaldehyde 4.7 mol and 2 g/L of a 25% aqueous solution of sodium alkyl sulfonate containing 10% of isotridecanol-ethylene oxide condensate and rinsed. The textile was impregnated with a composition containing C.I. Azoic Coupling Component 28, rinsed, and treated with C.I. Azoic Diazo Component 3 to give a level dyeing without any fold faults.

AB Fabrics from polyamide-hydroxylated fiber blends are dyed or printed with anionic dyes and fluorescent brighteners and treated with polyamines or their reaction product with HCHO or HCHO donors in the presence of catalysts. Thus, a 103:84 mixture of diethylenetriamine and dicyandiamide was condensed, neutralized with H₂SO₄, spray dried, heated with aqueous MgCl₂ and dimethylolhydroxyethyleneurea to give a water-soluble liquid A dyed polyamide-cotton blend (polyamide dyed with C.I. Acid Red 128) was impregnated with the above liquid containing 4% HOAc, dried, and heated at 180° for 40 s to give a textile with good wet-, wash-, and Cl-fastness.

AB The light- and washfastness of OH-group containing textiles dyed with basic dyes are improved by treatment with fixing agents consisting of either precondensates or mixts. of polyalkylenepolyamine reaction products with cyanamide, dicyandiamide (I), guanidine, or biguanidine and optionally dicarboxylic acids or esters or quaternary polyalkylenepolyamines, HCHO or a HCHO-generating compound and(or) an N-methylol compound of urea, melamine, guanamine, triazinones, urons, carbamides, or carboxylic acid amides, and a crosslinking catalyst for the methylol derivs. Thus, cotton dyed with a basic dye was padded with a solution containing 100 g/L I-diethylenetriamine-dihydroxydimethylolethyleneurea reaction product and squeezed to provide a liquor take-up of .apprx.80%. The fabric was dried on a pin tenter and cured for 30-45 s at 175-180°. The dyed fabric had very good fastness to wet processing, light, and washing, as well as improved crease resistance.

AB Silica reacts chemical with an amino compound in the presence of an alkali catalyst at a temperature just above the m.p. of the amino compound but below its b.p. to give amino silicates which provide resinous products when treated with aldehydes, alcs., and epoxides. Thus, a mixture containing fine granular silica 2, urea 2, NaOH 1, and water 10 parts was heated at 80-100° until the water evaporated and then at a temperature above the m.p. of urea but below its b.p. One mol grey urea silicate product was mixed with 1 mol HCHO (as an aqueous solution) and heated for 20-120 min at 70-100° until the desired viscosity as reached. The light-grey liquid poly(formaldehyde urea silicate) resinous product was useful as an adhesive and protective coating for wood.

- AB Acid dye colors on polyamides have only limited wet fastnesses (perspiration fastness and sea water fastness). After-treatments involving condensation products of naphthalenesulfonic acids, HCHO, and phenols improve the wet fastnesses. This improvement however is not heat-resistant. The fastness drop on heat-treated finished colored polyamides is avoided by treating the finished polyamide with a mixture of **dicyanamide**, HCHO, and ammonium or **amine** salts, with quaternized polyalkylenepolyamines or polyimines, or with polymeric quaternary salts, or aromatic ditertiary amines and aliphatic dihalogeno compds. (those mixts. being used normally to improve substantive color fastnesses on cotton). Thus, a polyamide fabric is colored with 2% C.I. Acid Red 155 (95°, Na2SO4, AcOH), rinsed, and treated with 6 g./l. of a condensation product of naphthalenesulfonic acids, HCHO, and phenols in the presence of HCO2H (15 min., 60°, pH 3, goods:liquor ratio 1:30). The substrate is dried and padded with a solution containing 4 g./l. condensation product of dicyandiamide, HCHO, and NH4Cl, then it is rinsed, dried, and heat fixed. The perspiration fastness test (DIN 54,020) gives good results while the untreated substrate does not.

AB **Fixers** for substantive **dyes** are prepared by condensing 1 part **amine** or **imine**, e.g., **dicyanodiamide** (I) or **biguanidine** (II), with 4 parts **HCHO** (III) at pH 4-5, in the presence or absence of **NH3** salts. III is added wholly or partially as **hexamethylenetetramine** (IV). When maximal **dye-fixing** ability of the solution is attained, as judged by titrating highly diluted samples with a standard substantive dye solution, the reaction is quenched either by cooling the mixture or by interrupting the addition of acid required to maintain the pH between the given limits or by spray-drying the product immediately. Thus, 168 g. I is stirred 1-2 hrs. at 90° with 132 g. (NH₄)₂SO₄ in 400 ml. water. On cooling to 20°, a crystalline mass of II ppts. Then 1100 g. of 30% III and 160 g. of 29% NH₃ solution are added to immediately form IV. The solution is acidified to pH 4.5-5.0 with 60° B.acte.e. H₂SO₄ and warmed at 80°. More acid is added to maintain the pH given. A dye stock solution is prepared by dissolving 1 g. Columbia Fast Red F and 1 g. Chicago Blue 6B with 5 g. calcined soda in 2 l. distilled water. Then 5 ml. of this stock solution is diluted with 20 ml. distilled water to give the standard solution for titrating with fixer. The fixing solution is prepared for titration by diluting 3 ml. reaction mixture to 1 l. with distilled water. The fixer solution is added to the dye solution until a spot test shows all the dye has been precipitated. Here the maximal fixing activity is reached. after approx. 2 hrs. Approx. 2.5 ml. diluted fixer solution is required to precipitate all the dye in the titration test.

PI AB Aliphatic amines, containing at least one OH-group (I) are treated with $\text{H}_2\text{NC}(:\text{NH})\text{NHCN}$ and HCHO and optionally aftertreated with metal compds. Examples for I are hoxyamines, such as $\text{NH}_2\text{C}_2\text{H}_4\text{OH}$ or polyamines, prepared by condensing halohydrins with NH_3 or aliphatic amines, e.g. polyhoxypypropylene polyamine-HCl obtained from α - γ -glyceroldi-Chlorohydrin with NH_3 . By condensing I with $\text{H}_2\text{NC}(:\text{NH})\text{NHCN}$ and HCHO a white, H_2O -soluble powder, useful as such or mixed with multivalent metal salts, preferably Cu-salts, for improving the fastnesses to H_2O , perspiration, and washing of direct dyeings on cellulosic fibers results.

AB A detergent containing a **color-transfer** inhibiting **color-fixing** agent, which may be obtained from reaction (a) of amines with epichlorohydrin or (b) of **cyanamide** with **amines** and **formaldehyde** contains addnl. nonionic surfactants, anionic surfactants, detergent builders, cationic surfactants, dye transfer inhibiting agents, soil release polymers, cellulase or bleaching agents. The effect of the **color-fixing** agents was investigated using five com. laundry detergents and white and colored textiles. The ΔE values observed showed a remarkable difference compared with laundry detergents without using the inventive **color-fixing** components.
